

6.2 WEATHER DELAY LOG

Purpose: Weather delays are one of the most common causes of construction schedule changes. This log helps you track weather-related delays, document their impact on your project timeline, and plan recovery strategies. This documentation is valuable for insurance claims, lender updates, and managing subcontractor schedules.

Instructions:

- Record any day when weather prevents or significantly delays work (even partial days)
- Be specific about weather conditions - "heavy rain" is better than "bad weather"
- Document which trades/tasks were affected - some work can continue in certain weather
- Track cumulative delays to understand total schedule impact
- Note any costs incurred due to weather delays (extended equipment rentals, etc.)
- Update your master schedule when weather causes significant delays

Common Weather Conditions That Delay Construction:

- *Rain - affects concrete pours, roofing, exterior painting, drywall delivery*
- *Snow/Ice - affects all outdoor work, material deliveries, site access*
- *Extreme Cold - affects concrete curing, paint application, some materials*
- *Extreme Heat - affects worker safety, some material installation*
- *High Winds - affects roofing, siding, crane operations, safety*
- *Mud/Site Conditions - even after rain stops, site may be unusable*

Project Weather Delay Summary

Project Name: _____ **Project Address:**

Original Completion Date: _____ **Current Projected Completion:**

Total Weather Delay Days to Date: _____ **Schedule Impact (days):**

Tips for Managing Weather Delays

- Monitor weather forecasts and plan accordingly
- Build weather contingency time into your original schedule (10-15% is typical)
- Have indoor tasks ready to work on during bad weather days
- Protect materials and work-in-progress from weather damage
- Communicate schedule impacts to subcontractors immediately
- Take photos of weather conditions causing delays for documentation
- Review your insurance policy to understand weather-related coverage
